### Does the GX31 Family Support Wake-on-LAN?

The ZPC-GX31 and the iOne-GX31 support Wake-on-LAN functionality through the Windows operating system. This function can be activated through the Device Manager.

1. Open the Device Manager and navigate to the Network adapters category. Expand this category and locate the Network device to utilize for Wake-on-LAN. Right click it and select Properties.
2. When the details window appears, click the tab Power Management. Make sure the option Allow this device to bring the computer out of standby is selected, and press OK.

See the picture in the attachment below for reference.
